外科手術とステントグラフトの割合(AAA待機術:米国)

EVAR Trial 1 : Summary of findings

EVAR versus open repair in the mid-term

- **Lower operative mortality : 1.7% vs 4.8% = 3%**
- **Lower aneurysm related mortality : 4% vs 7% = 3%**
- **All cause mortality : no difference**
- **HRQL : no difference** (Health Related Quality of Life)
- **More expensive**
- **Higher re-intervention rate with surveillance need
not affecting mortality**

Survival Rate

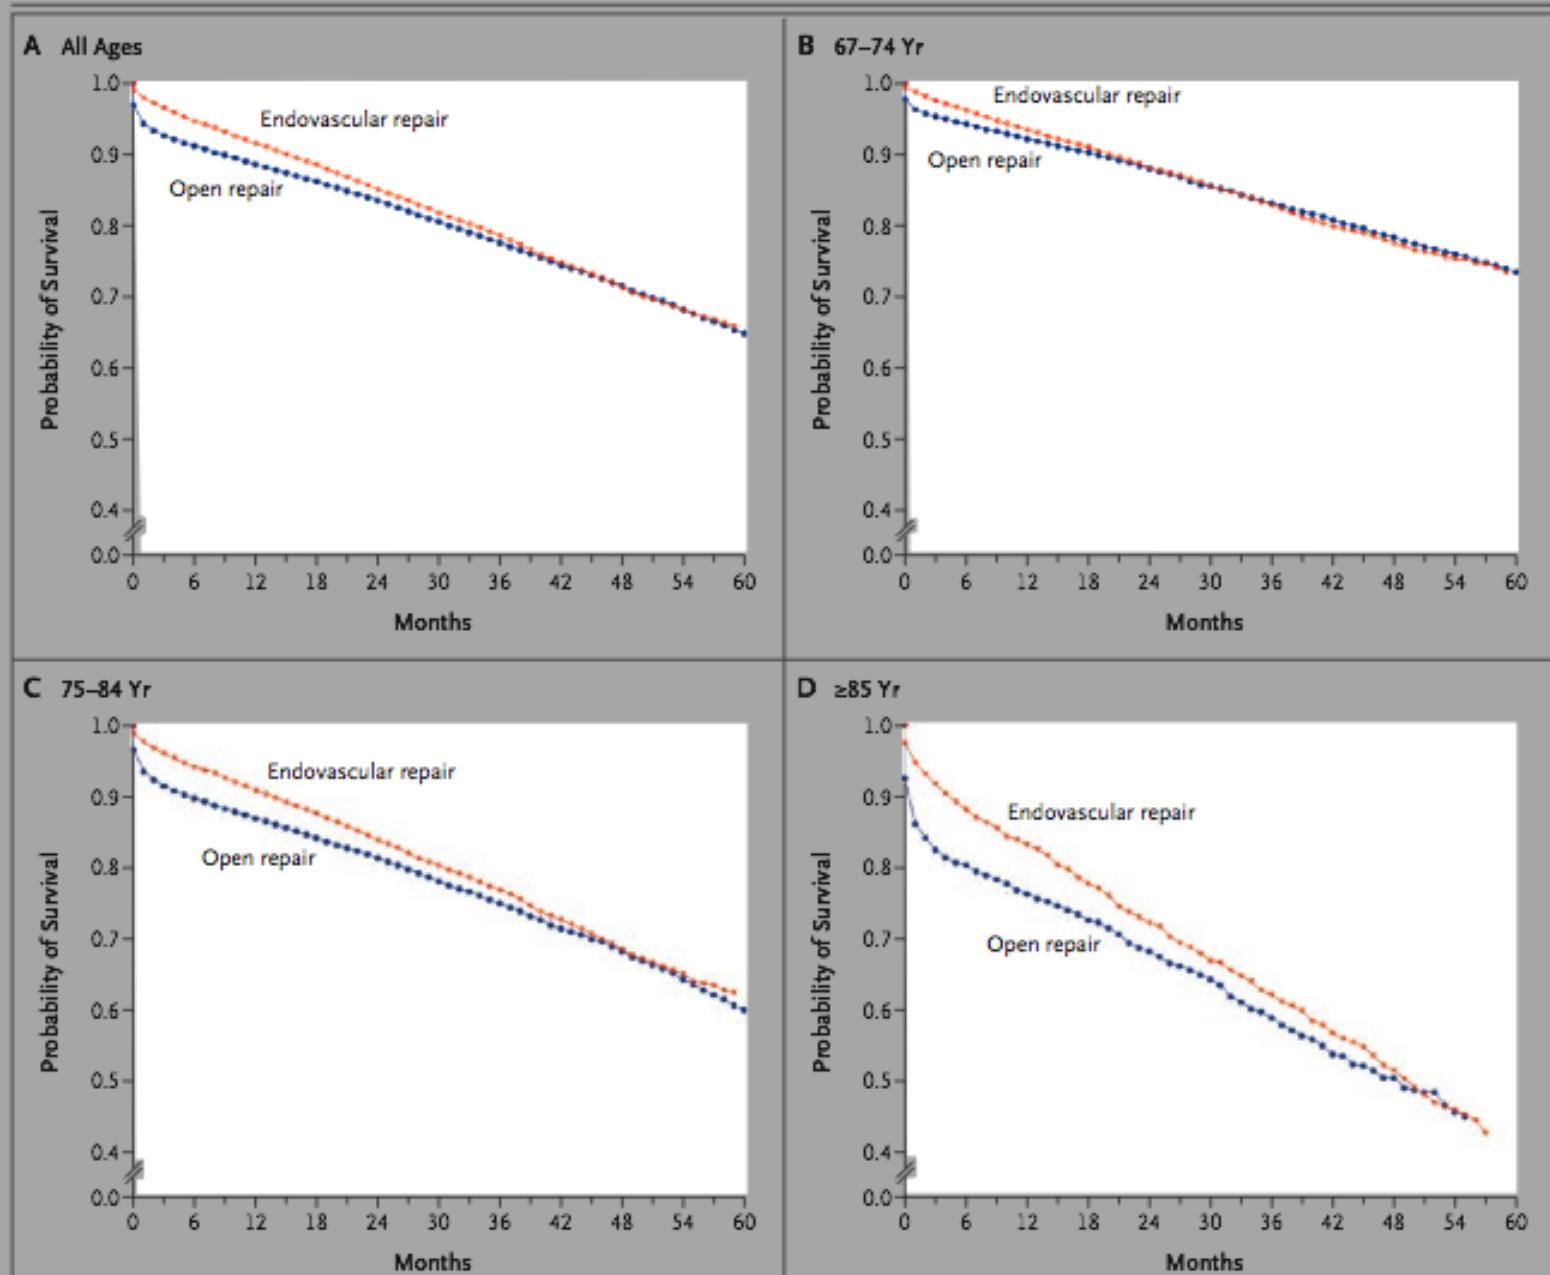

Figure 2. Survival of Patients Undergoing Endovascular Repair or Open Repair of Abdominal Aortic Aneurysms, Overall and According to Age.
Data are shown for all patients (Panel A), for those 67 to 74 years of age (Panel B), those 75 to 84 years of age (Panel C), and those 85 years of age or older (Panel D).
